Spectral Data

Spectral Data

Spectral Data

Row 1004

Setup

- Mk 421 observed with LETG/ACIS
- Pointings, 60 ks each
- Y-axis dither is nominal ($\pm 8''$, 1000 s period)
- Z-axis dither is expanded
 - $\pm 64''$ to span 128 rows
 - Period of 2647 s (rate is 2.1x normal)

High Row

Setup of BD 12/15

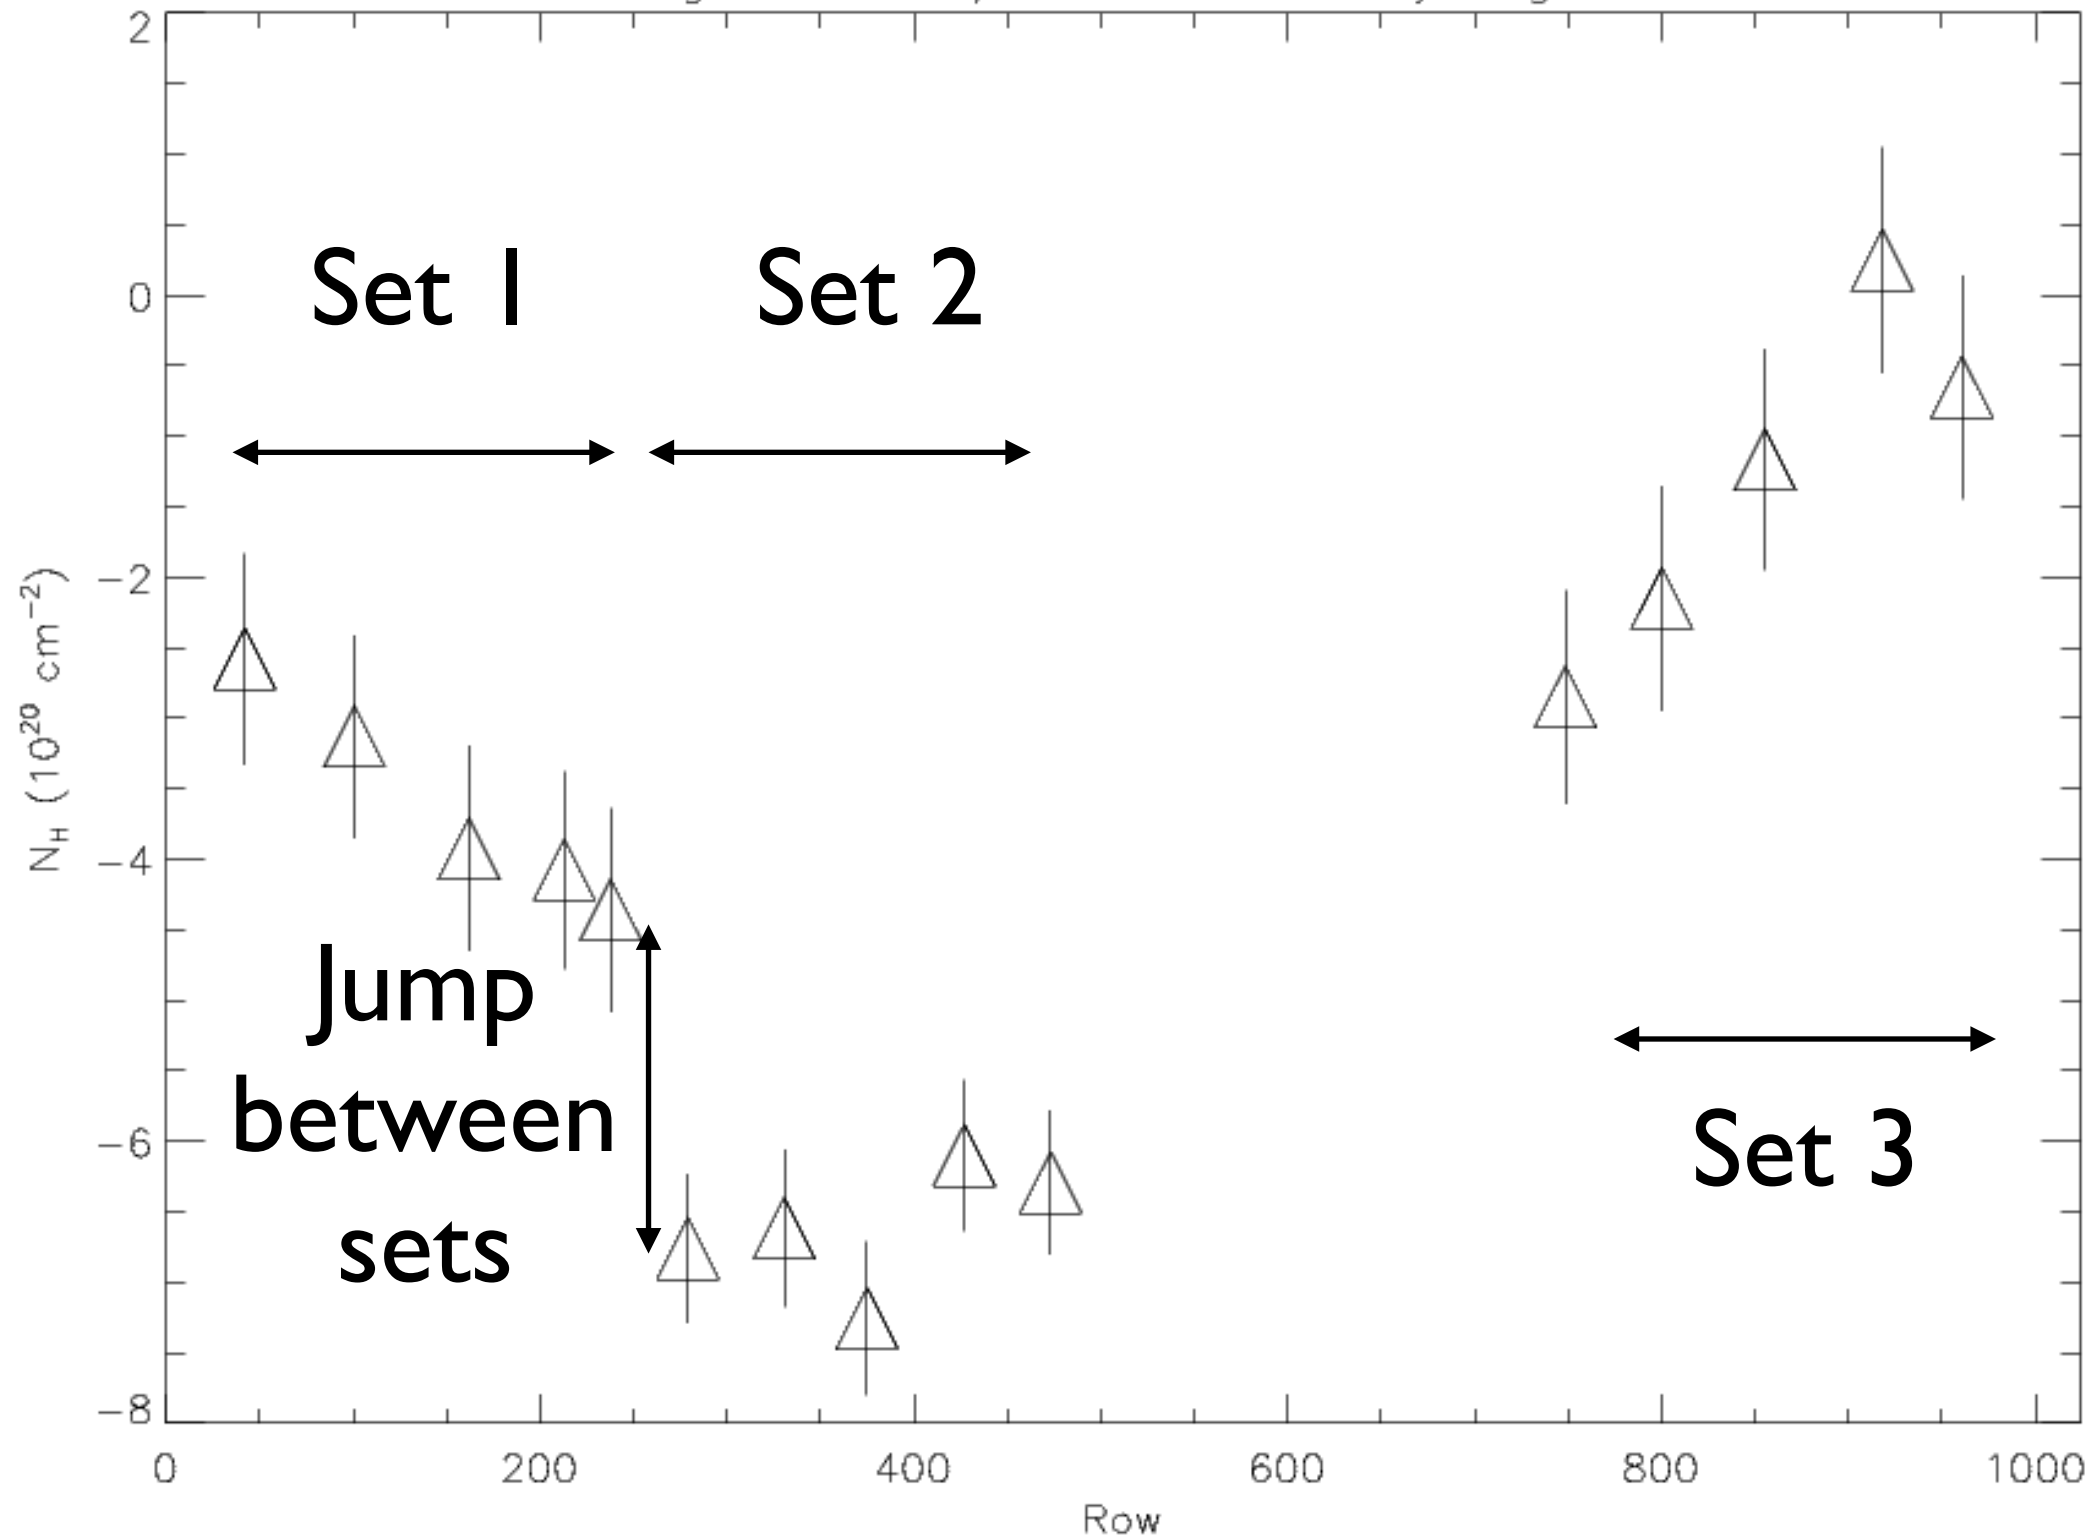

- Same as other Big Dither Observations:
 - Mk 421 observed with LETG/ACIS
 - Dither amplitude was $\pm 64''$ in Z $\pm 8''$ in Y
- Same as others except:
 - Bottom half = rows 15-480
 - Top half: rows 725-975
 - 48-50 ks observations (prev: 60 ks)

Fit Methods

- All: $N_H = \text{Galactic}$ (1.61×10^{20} for Mk 421)
- Single obs'n: curvepl + CFO (6 params)
- Dither set (single obID, split to 5 regions)
 - region is a range of rows, eg: 15-70, 70-130
 - curvepl (3 params = norm, slope, curvature)
 - CFO ODs for each region (15 params)
 - Const norm, wrt region 1 (4 params)
 - Optional: extra N_H for each region (5 params)

Free N_H fits: oddities

Big Dither 12/2015: Excess Hydrogen

Issue for $E < 0.28$ keV

Issue for $E < 0.28$ keV

Is There Much H?

Linking N_H to C or O

- Free N_H affects both C and O optical depths
- Could fix N_H/O ratio for fits

Chandra Contamination — IACHEC II

Spatial Distribution

Big Dither 2015 – Model from 3/14

O/C Spatial/Temporal

Summary

- $\tau(\text{row})$ fits: τ_C increased 0.66 from 3/15 to 12/15
 - Increased 0.46 from 3/14 to 3/15
- No longer relying on fits with free N_H
 - Free N_H fits are better but jumps between sets
 - Could try tying N_H to τ_O
- O/C increased to 0.14 at the center of the detector
 - τ_O/τ_C was 0.10 in 2014
 - τ_O/τ_C is still higher in the center than edges
- F/C is slightly higher, from 0.033 to 0.036 ± 0.001
 - τ_F/τ_C is higher below row 100, up to 0.05
