NICER

Neutron star Interior Composition Explorer

Current and Future Tools for Modeling NICER Background

Craig Markwardt (NASA/GSFC)
on behalf of NICER Team

MIT KAVLI
INSTITUTE

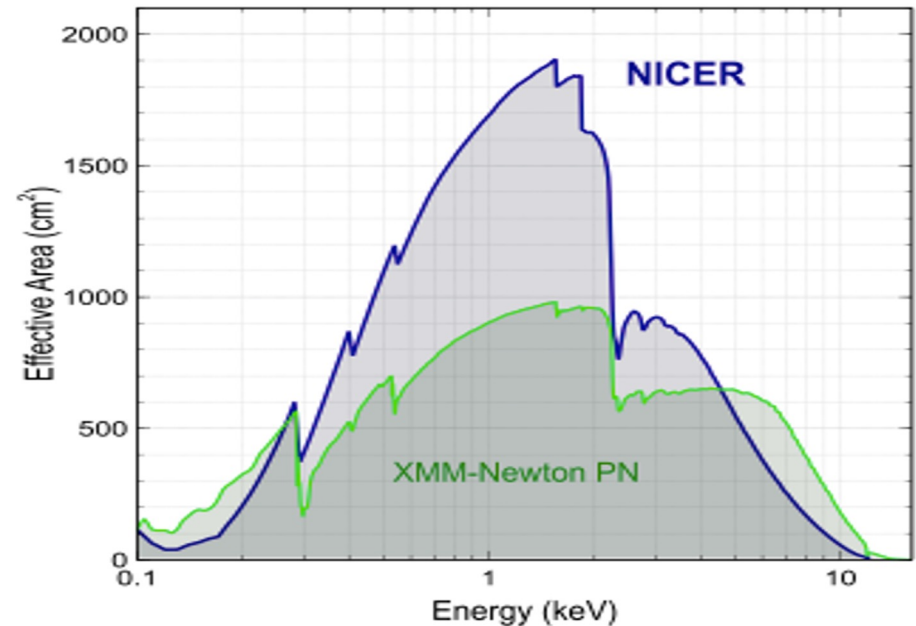

MOOG

What is NICER?

- Platform: International Space Station
(51.6° inclination)
- Launch: June 2017
- Instrument: X-ray (0.2–12 keV) “concentrator” optics and silicon-drift detectors; GPS position & absolute time tagging
- Spectral band: 0.2–12 keV
 - 52 operating single-pixel silicon detectors
- Energy resolution: < 150 eV @ 6 keV
- Timing resolution: 100 nsec RMS
- **Non-imaging field of view**
 - 6 arcmin diam. (half-max)

Understanding NICER Background

- NICER is a non-imaging instrument
 - Unlike CCD imagers, “off-source” background events are not available
- NICER is subject to several forms of background
 - Astrophysical (CXB, LHB, Halo, other diffuse or point-like sources in the FOV)
 - Non X-ray Backgrounds (SAA, Trapped Electrons, Precipitating Electrons, Geomag storms, Cosmic Rays)
- **These backgrounds must be modeled**, and there are several background modeling tools available

https://heasarc.gsfc.nasa.gov/docs/nicer/tools/nicer_bkg_est_tools.html

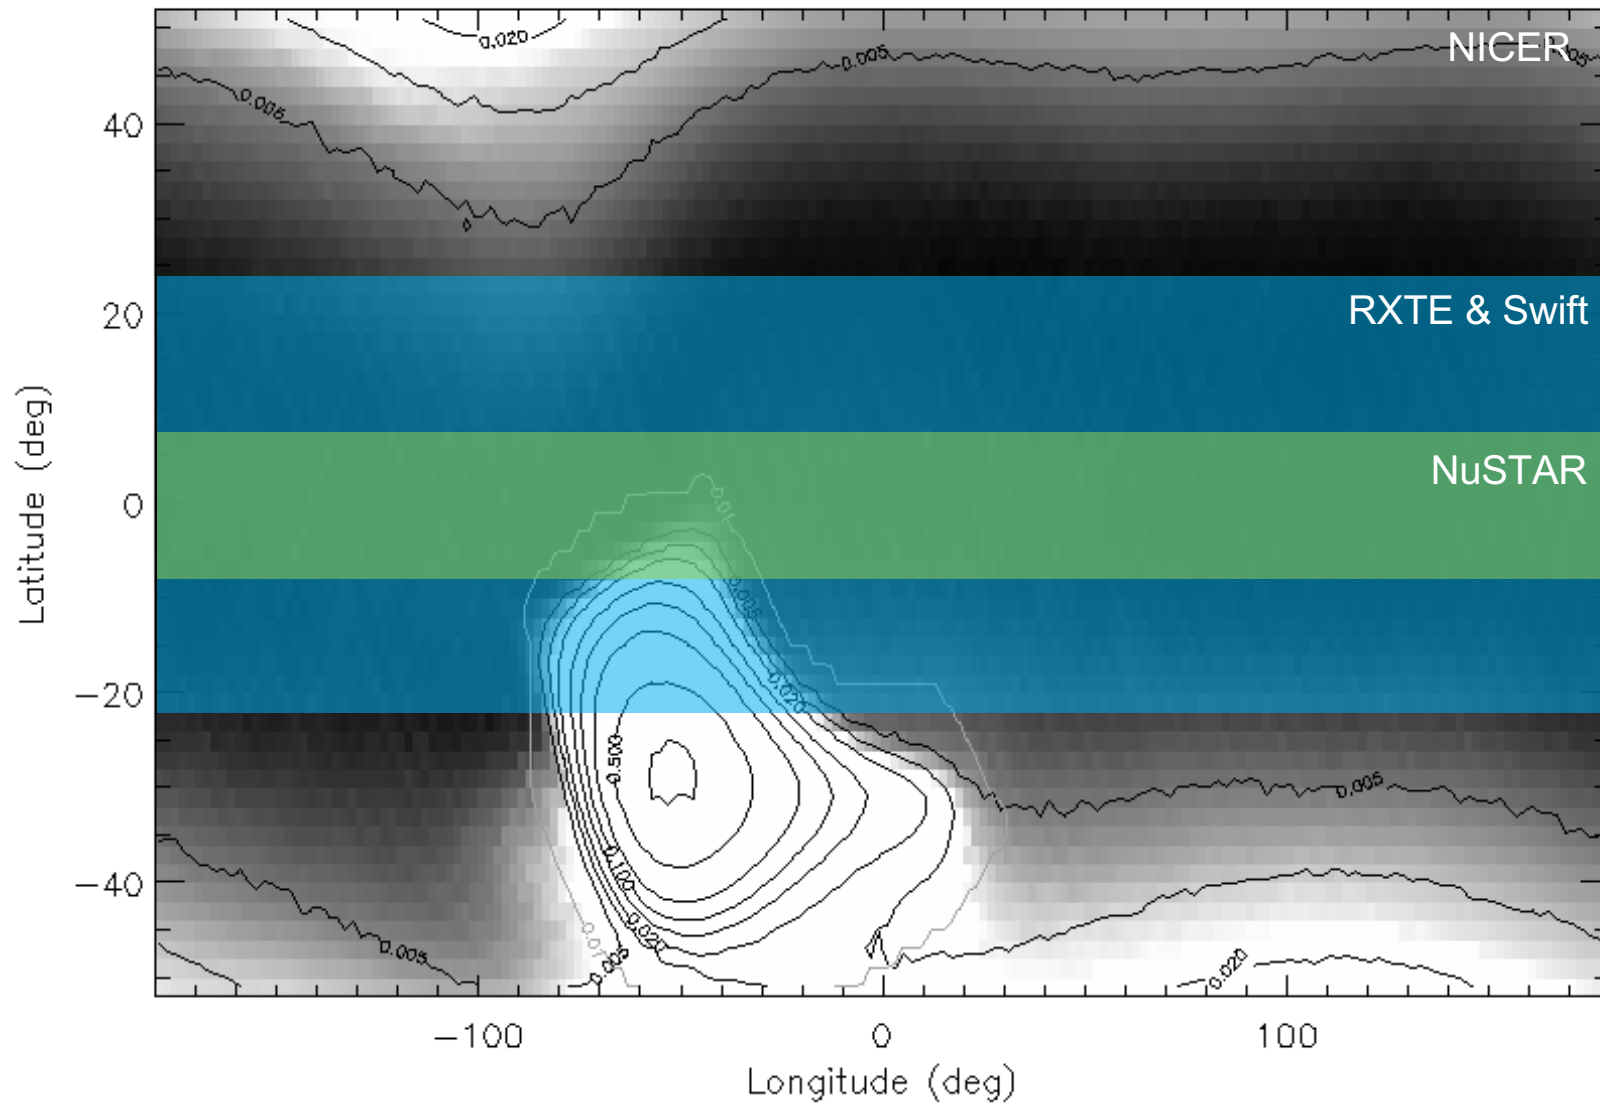

NICER Comparison to Other Missions (HEO)

- Chandra, XMM, INTEGRAL: elliptical, high-altitude orbits
- NICER / ISS is circular low earth orbit ($< 0.1 R_e$)

Comparison to LEO X-ray Observatories

- NICER (ISS) inclination (51.5°) orbit samples greater variety of backgrounds

Geographic Overview of Dominant NICER Background Contributors

Trapped
Electrons
(TREL)

Precipitating
Electrons
(PREL)

NICER Background Modeling Options

- Current
 - “**3C50**” – a library model based on NICER HK developed by Ron Remillard (NICER & MIT)
 - “**Space Weather**” – a library model based on geomagnetic quantities developed by Keith Gendreau and Michael Corcoran (NICER)
 - See “NICER Background Estimator Tools” webpage for more information
https://heasarc.gsfc.nasa.gov/docs/nicer/tools/nicer_bkg_est_tools.html
- Future
 - “**SCORPEON**” – a template-based model in development by Craig Markwardt (NICER)
 - Machine learning techniques

How to Use NICER Background Tools

- Currently available NICER background tools are separate add-on software packages, available from the NICER Background Estimator Tools web page
 - Users must install the tools separately
 - 3C50: more HEASoft-like command-line interface
 - Space Weather model requires Scientific Python
 - Users may also need to re-run the standard pipeline (nicerl2) to add model-specific columns such as geomagnetic Kp
- **Near-term goal for next NICER release is that these tools will be a standard part of NICER's software**

NICER 3C50 Model Example

- 3C50 is a library model that uses two non-source count rates
 - “IBG” 15-17 keV rate (out of optic passband)
 - “HREJ” (events whose slow- and fast-channel pulse heights do not match)
 - Divide this parameter space into cells and measure mean background in each cell based on dedicated background observations

- For a given spectrum, 3C50 tool finds dwell time in each cell and constructs composite spectrum as a weighted sum of library spectra

- Example call

```
nibackgen3C50 rootdir='dataparentdir' obsid='2010100101' \  
  bkgidxdir='mybackdir/bg_models_3C50' \  
  bkglibdir='mybackdir/bg_models_3C50' gainepoch='2019'
```

Future Background Developments

- Machine Learning techniques being attempted with some success (A. Zoghbi)
- SCORPEON: attempt to separate backgrounds into physically-motivated components
 - “template” which are parameterized by housekeeping values
 - Parameterized background, fittable in XSPEC, as well as fixed estimate for spectra & light curve
 - STATUS: in development & testing

Types of Background Components

CON

Constant
NXB, Sky

SAA

Summary

- NICER background models are available today as separate downloads
(See “NICER Background Estimator Tools” webpage for more information
https://heasarc.gsfc.nasa.gov/docs/nicer/tools/nicer_bkg_est_tools.html)
- These estimator tools will be part of the next NICER standard software release
- There are new background modeling concepts in development
